Migration of Species

This topic is the result of activities of students and teachers in Spain, Austria, Denmark and the UK during the Comenius school partnership **Migration of Species** (2008-2009).

The vision for the international school project entitled 'Migration of Species' is that of an international group of students engaged in collaborative learning and motivated to both understand the nature of science and become globally aware citizens. The project aims to enable learners to improve key skills in communication, modern languages, research, and data analysis, through collaborative work supported by enquiry based learning. Importantly, learners improve their ICT skills which support their learning in all subjects.

If you take part you can publish your findings through 'Making the News'. You will be able to see reports from others in the **Science Across the World section of 'Making the News'**. On the homepage of '**Migration of Species**' you will find instructions for your first 'publication'.

There is also an opportunity to videoconference for free using **Flashmeeting** and communicate with other students from other schools in other countries.

This topic is in ? parts.
